

- colouration of silicone
- carrier material is a silicone oil
- preparation intermixes with the silicone without influencing the reaction behaviour of the application system
- remains gas-free during polymerisation
- high pigment content level and high degree of dispersion
- the preparation is pasty and can be adjusted according to technical needs
- high degree of migration stability
- suitable for indoor and outdoor
- organic and inorganic preparations as well as metal effects can be offered
- technical requirements for light and weather resistance, temperature and migration fastness can be matched to suit application conditions

**Preferred applications:** in chemical building industry, paint and lacquer industry as well as in electronics and mechanical engineering industry
